
The formal definition of the unilateral or one-sided Laplace integral is:

$$\mathcal{L}\{f(t)\} = F(s) = \int_0^{\infty} f(t) e^{-st} dt$$

In case $f(0)$ does not exist, one can use

$$\mathcal{L}\{f(t)\} = F(s) = \lim_{\varepsilon \downarrow 0} \int_{\varepsilon}^{\infty} f(t) e^{-st} dt$$

Linearity:

$$\mathcal{L}\{af(t) + bg(t)\} = aF(s) + bF(s)$$

Convolution:

$$\mathcal{L}\{f(t) * g(t)\} = \int_0^{\infty} f(\tau) g(t - \tau) d\tau = F(s) \cdot G(s)$$

Initial value theorem:

$$f(0^+) = \lim_{s \rightarrow \infty} sF(s)$$

Final value theorem:

$$f(\infty) = \lim_{s \rightarrow 0} sF(s)$$

if all poles of $sF(s)$ are in the left half-plane.

Table 1: Laplace transforms.			
Function	$f(t)$	$F(s)$	Convergence
Unit impulse	$\delta(t)$	1	For all s
Delayed unit impulse	$\delta(t - \tau)$	$e^{-\tau s}$	$\Re(s) > 0$
Unit step (Heaviside)	$H(t)$	$\frac{1}{s}$	$\Re(s) > 0$
Delayed unit step (Heaviside)	$H(t - \tau)$	$\frac{1}{s} e^{-\tau s}$	$\Re(s) > 0$
Ramp	t	$\frac{1}{s^2}$	$\Re(s) > 0$
Power (n integer)	t^n	$\frac{n!}{s^{n+1}}$	$\Re(s) > 0, n > -1$
Exponential decay	e^{-at}	$\frac{1}{s + a}$	$\Re(s) > -a$
Exponential approach	$1 - e^{-at}$	$\frac{1}{s(s + a)}$	$\Re(s) > -a$
Sine	$\sin(\omega t)$	$\frac{\omega}{s^2 + \omega^2}$	$\Re(s) > 0$
Cosine	$\cos(\omega t)$	$\frac{s}{s^2 + \omega^2}$	$\Re(s) > 0$
Hyperbolic sine	$\sinh(\alpha t)$	$\frac{\alpha}{s^2 - \alpha^2}$	$\Re(s) > \alpha $
Hyperbolic cosine	$\cosh(\alpha t)$	$\frac{s}{s^2 - \alpha^2}$	$\Re(s) > \alpha $
Exponential decay sine	$e^{-at} \sin(\omega t)$	$\frac{\omega}{(s + a)^2 + \omega^2}$	$\Re(s) > -a$
Exponential decay cosine	$e^{-at} \cos(\omega t)$	$\frac{s + a}{(s + a)^2 + \omega^2}$	$\Re(s) > -a$
n th root	$\sqrt[n]{t}$	$\frac{1}{s^{\frac{1}{n}+1}} \Gamma\left(\frac{1}{n} + 1\right)$	$\Re(s) > 0$
Natural logarithm	$\ln t$	$\frac{-\ln(s) - \gamma}{s}$	$\Re(s) > 0$
