

This small example shows how to simulate a DOS-box as frequently seen in Windows programs. It makes use of the `tcloborbox` and `listings` packages.

For output of the program, see Figure 1.

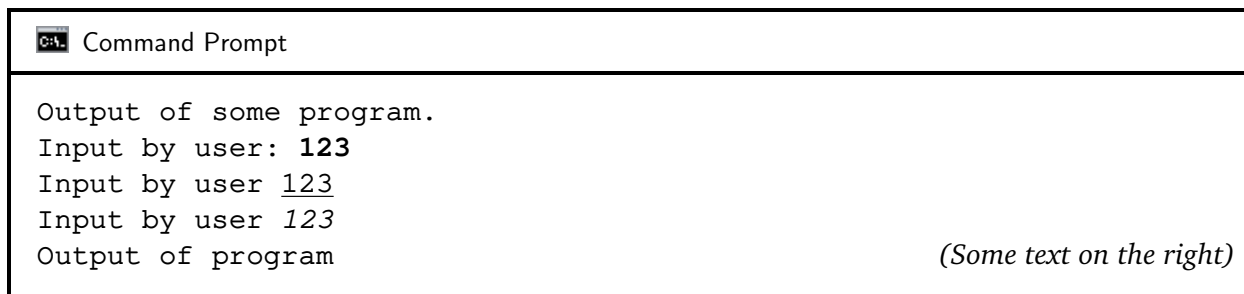

Figure 1: Output of some program.

This box is generated with:

```
\begin{dosbox}[title=Output of some program.,label=fig:output]  
Output of some program.  
Input by user: (*\textbf{123}*)  
Input by user (*\underline{123}*)  
Input by user (*\emph{123}*)  
Output of program (*\hfill\normalfont\emph{(Some text on the right)}*)  
\end{dosbox}
```

Use `title=...` to set your caption text.

Use `blend before title` code to explicitly copy the format of your caption setup.
